

HEAVY DUTY TRANSMISSION DYNO

Driveline Services Australia now offer heavy duty transmission testing as their latest in house service.

Our **Heavy Duty Transmission Dyno** service is available for testing and fault diagnostics specialising in **Dana/Clark**.

Our testing equipment accommodates all sizes of off highway transmissions, power shift and manual shift, including drop box and remote mounted configurations.

Performing true full throttle, load-induced downshifts, the load unit can push test transmissions into first gear and hold them there, even with the drive system set at full throttle.

Precise load control allows the operator to select everything from no-load to full-load with unmatched precision and the ability to perform pinpoint shift detection.

Transmission problems... give your Driveline team a call today, and we will get you shifting **smoothly** again.
